a)

the number of virtual pages is the size of the virtual address space divided by the page size:

$$\#\text{virtual pages} = \frac{2^{\text{virtual bits}}}{\text{page size}} = \frac{2^{\text{virtual bits}}}{2^{\text{offset bits}}} = 2^{\text{virtual bits}-\text{offset bits}}$$

the offset needs $\log_2(\text{page size})$ bits, and the page number uses the remaining bits. so the maximum number of virtual pages is $2^{|p|}$.

	design 1	design 2	design 3
virtual address bits	16	32	36
page size	$32 = 2^5$	$64 = 2^6$	$128 = 2^7$
offset bits $\|d\|$	5	6	7
page number bits $\|p\|$	$16 - 5 = 11$	$32 - 6 = 26$	$36 - 7 = 29$
max virtual pages	$\mathbf{2^{11}}$	$\mathbf{2^{26}}$	$\mathbf{2^{29}}$

- **design 1:** $\frac{2^{16}}{2^5} = 2^{11} = \mathbf{2{,}048}$ pages
- **design 2:** $\frac{2^{32}}{2^6} = 2^{26} = \mathbf{67{,}108{,}864}$ pages
- **design 3:** $\frac{2^{36}}{2^7} = 2^{29} = \mathbf{536{,}870{,}912}$ pages
